

Sales Performance Review

Board Presentation

Findings and Recommendations

24 Apr 2026 - 30 Apr 2026

Magdalena Bronowska

Executive Snapshot

Total Revenue

£95.82K

Total Orders

213

Average Order
Value

£449.84

Promo Usage %

23.94%

Total Units

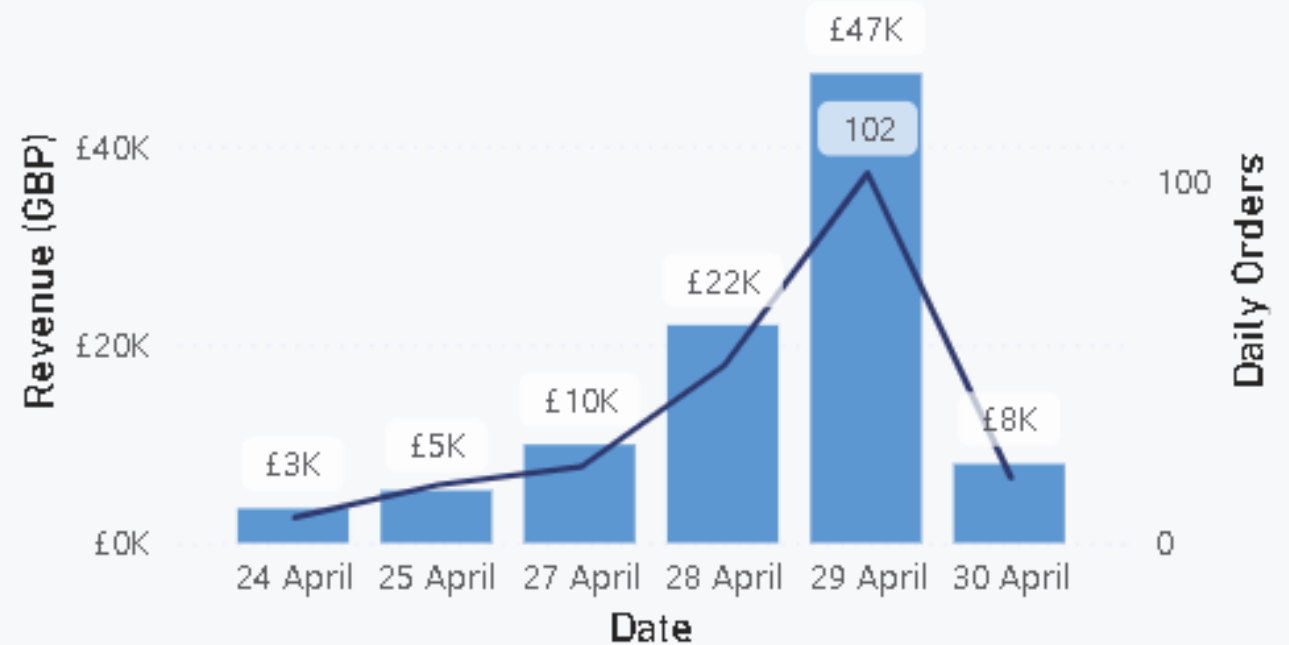

1086

Revenue Per Unit
(GBP)

£88.23

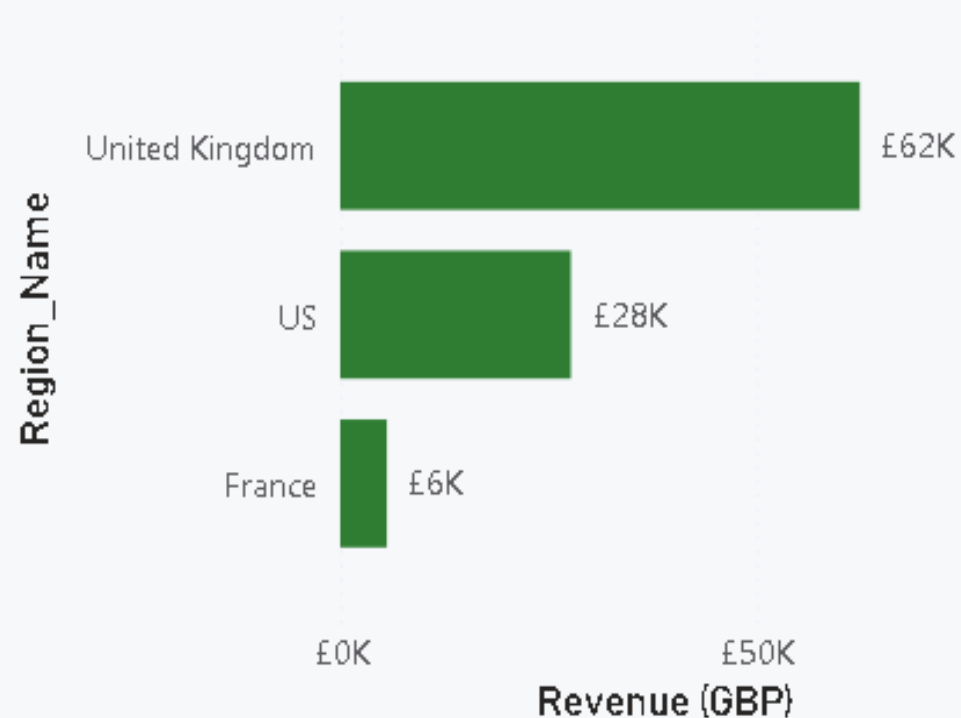

Revenue Trend by Date

● Sum of Revenue ● Daily Orders

Revenue Concentration

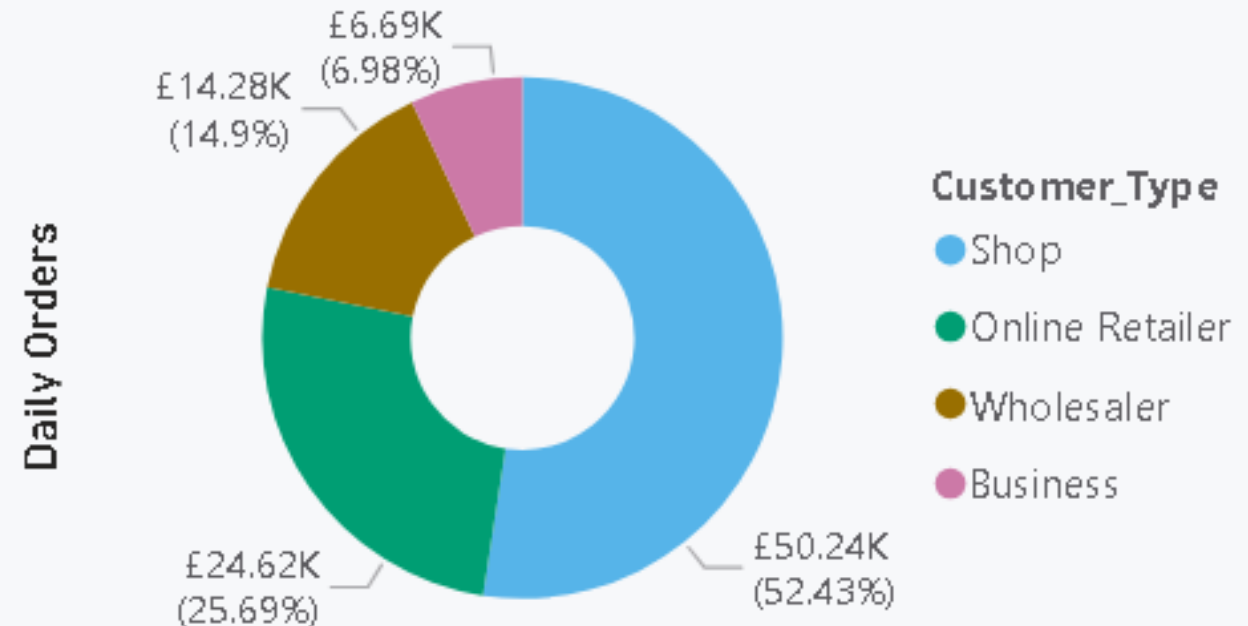

Revenue by Region

- Revenue is concentrated in UK and US
- Customer mix is led by Shops, then Online Retailers

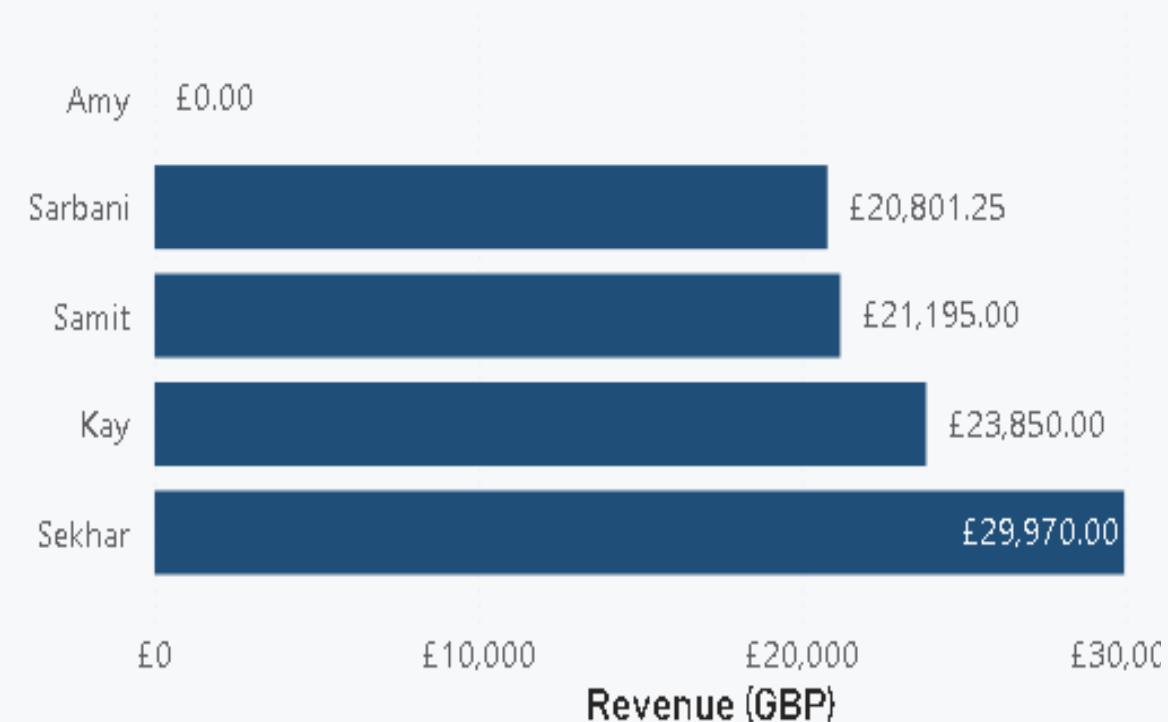

Recommendation: protect the strong segments (UK and Shops), and grow smaller segments with targeted offers.

Revenue by Customer Type

Sales Rep Performance

Revenue by Sales Rep

- Performance is uneven across reps
- Top performers drive a large share of revenue
- One probationary rep has zero output in period

Recommendations:

- Copy what top reps do well.
- Put probation and low-performing reps on a recovery plan.
- Track each rep with simple KPIs.

Risk: Reps on Probation or Low Output

Sales_Rep_ Name	Manager Name	On Probation	Years Of Service	Sum of Revenue
Samit	Alessandra	N	9	£21,195.00
Kay	Alessandra	N	8	£23,850.00
Sarbani	Wenbo	N	3	£20,801.25
Sekhar	Alessandra	N	2	£29,970.00
Amy	Wenbo	Y	1	£0.00
Total			23	£95,816.25

Promotion Effectiveness

Promo Orders

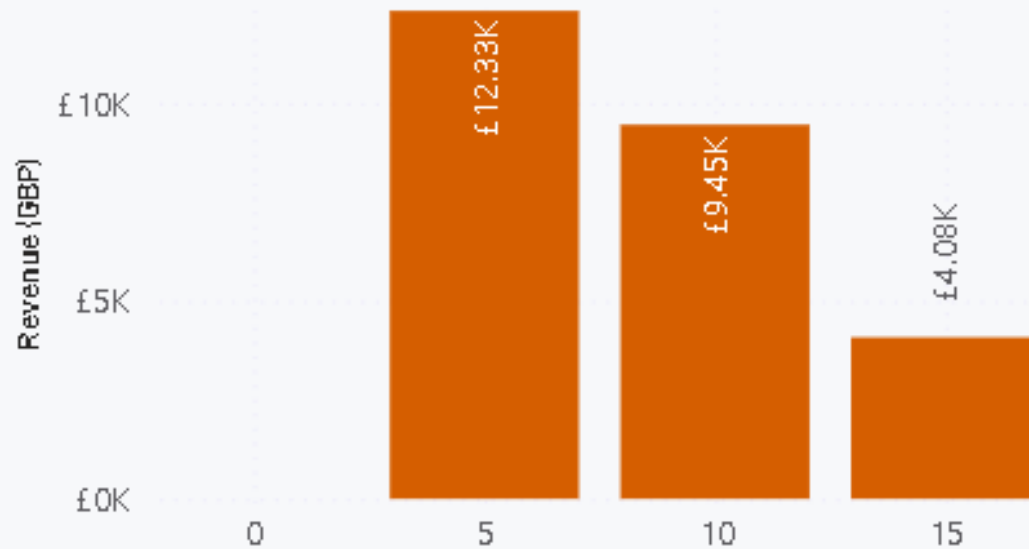

51

Promo Revenue

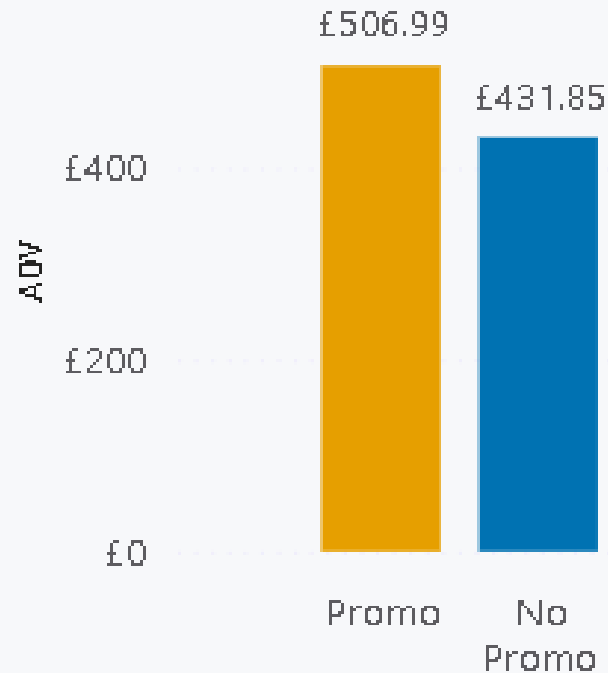

£25.86K

Revenue by Promotion Type

Promo_Flag ● Promo

AVO Promo vs No Promo

- 5% and 10% discount tiers outperform 15% on value
- Promotions support volume but need discount discipline

Recommendations:

- Prioritize 5% and 10% tiers; restrict 15% to clear strategic cases.

Add approval guardrails for higher discounts.

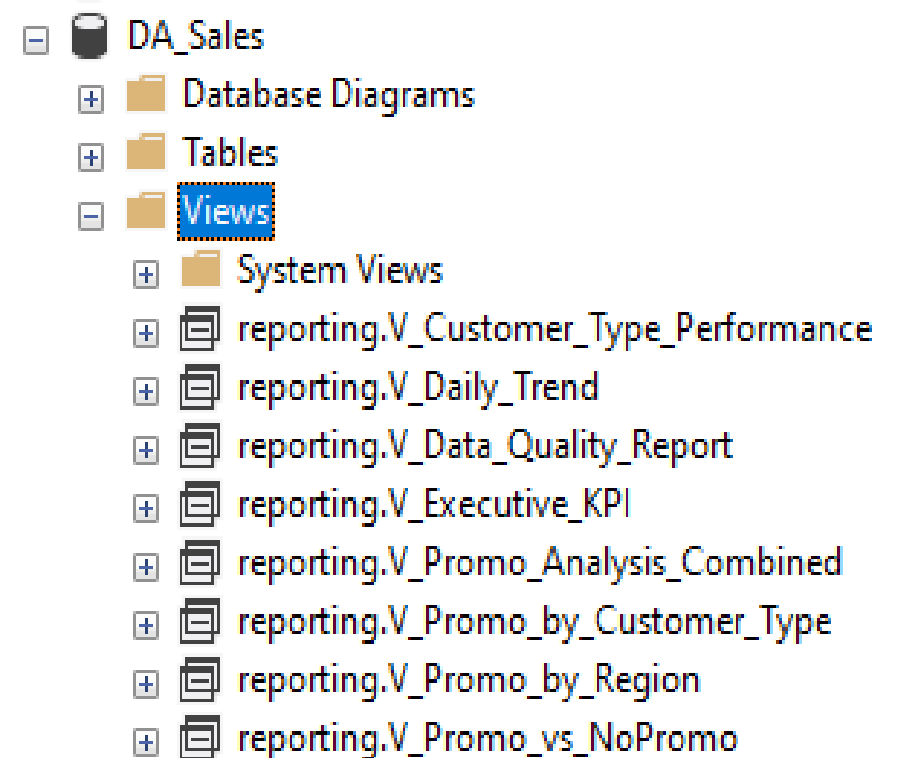

Decision Summary

- Defend and expand core revenue pools (UK, Shop/Online)
- Improve rep consistency through manager-led coaching
- Optimize promo mix toward lower discount tiers

Expected outcome: sustain growth while improving revenue quality

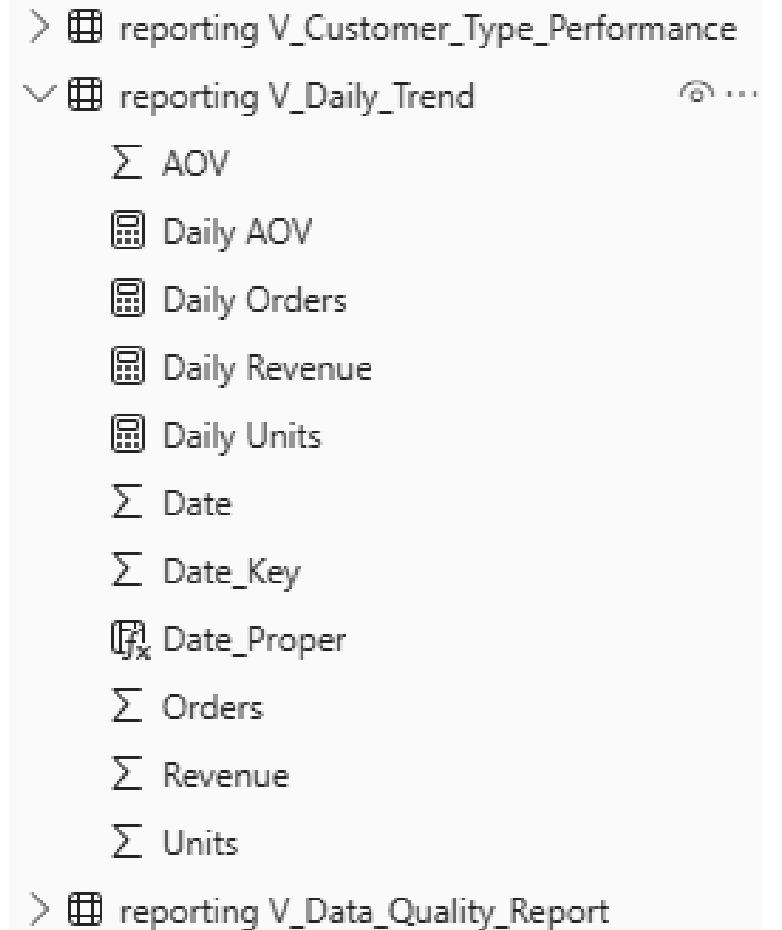

Approach Overview

1. Reviewed raw data and checked the main fields.
2. Cleaned data in SQL and created reporting views.
3. Used views in Power BI to build dashboard.
4. Used outputs to build short business narrative.

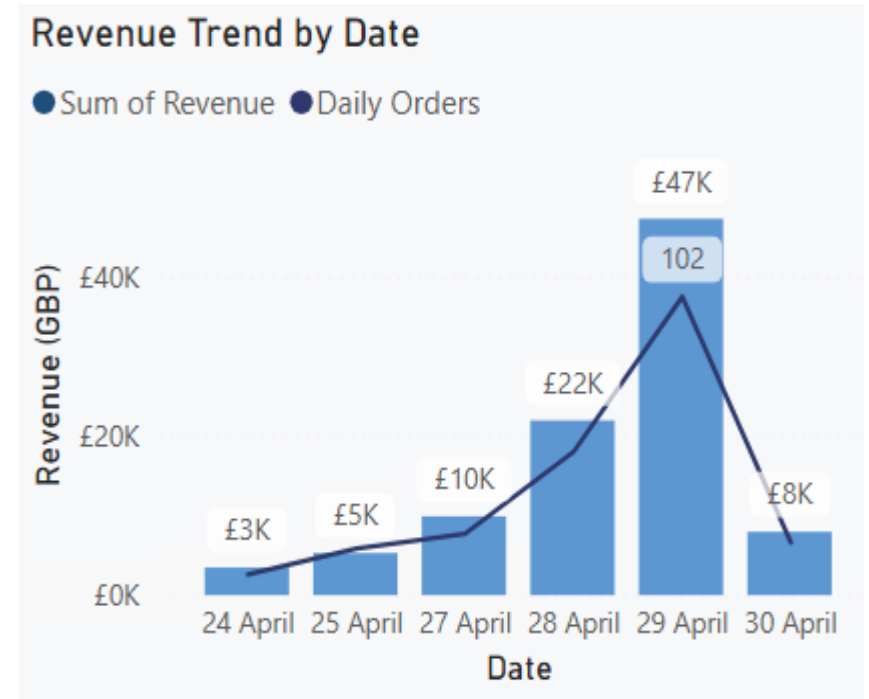

Build Choices and Why

1. Keep most of the transformation work in SQL and keep Power BI focused on visuals and lightweight measures.
2. Used reporting views as a semantic layer

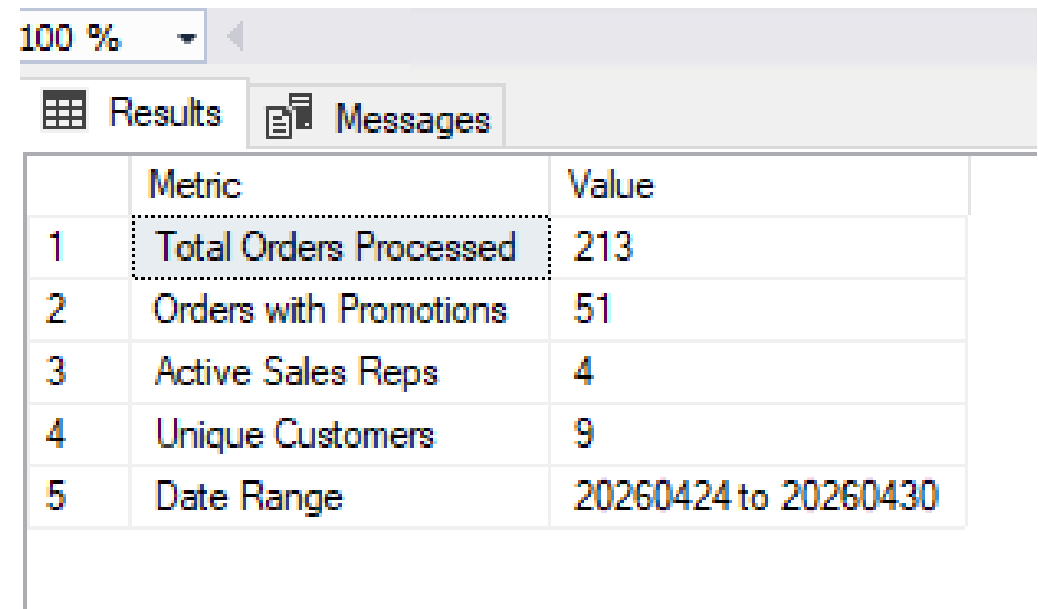

Key Assumptions

1. Data as a valid short-term snapshot of data activity.
2. Revenue is the main performance measure.
3. Promotion effectiveness could be assessed through revenue, order volume, average order value, and revenue per unit.

Data Challenges and Limitations

1. Proper date format.
2. Model design.
3. Business interpretation.
4. Short time window.

A screenshot of a software interface showing a data results window. At the top, there is a zoom level dropdown set to '100 %' and a navigation bar with 'Results' and 'Messages' tabs. The 'Results' tab is active, displaying a table with 5 rows of data. The table has two columns: 'Metric' and 'Value'. The first row is highlighted with a dotted border. The data is as follows:

	Metric	Value
1	Total Orders Processed	213
2	Orders with Promotions	51
3	Active Sales Reps	4
4	Unique Customers	9
5	Date Range	20260424 to 20260430

What I Would Do Next

1. Load longer history.
2. Add cost and margin promotion data.
3. Fact and Dimensions table in Power BI.
4. Automate a weekly performance.
